# Introduction

WINCOMM

Glenn Research Center

In order for TAMDAR data to be the most effective, it should be datalinked off the aircraft in a timely manner.

To test the initial concept of transmitting TAMDAR information off an aircraft, two systems were evaluated by WINCOMM.

Satellite based

- Echoflight

Air-to-Ground / Air-to-Air

- UAT

# Introduction

WINCOMM

Glenn Research Center

To provide data for transmission off the aircraft, a TAMDAR sensor was mounted on NASA GRC's Twin Otter.

A series of arcs were flown at different altitudes and ranges from a ground station installed at the Mansfield, OH airport (MFD).

# Introduction

WINCOMM

Glenn Research Center

The TAMDAR sensor was polled for all data at a 3.2 second interval.

A portion of the sensor data was encoded in a 30 ASCII character string for transmission.

- The data was not encoded in a standards based format, due to ongoing changes in formatting at the time of the flights.
- The formatting of weather sensor data is being worked in the Architectures and Requirements element of WINCOMM.

# Echoflight Overview

WINCOMM

Glenn Research Center

The Echoflight system utilizes the Orbcomm satellite system, which is in a Low Earth Orbit (LEO)

A standard aircraft VHF antenna, used for all communication to and from the Orbcomm system, was mounted on the upper portion of NASA GRC's Twin Otter.

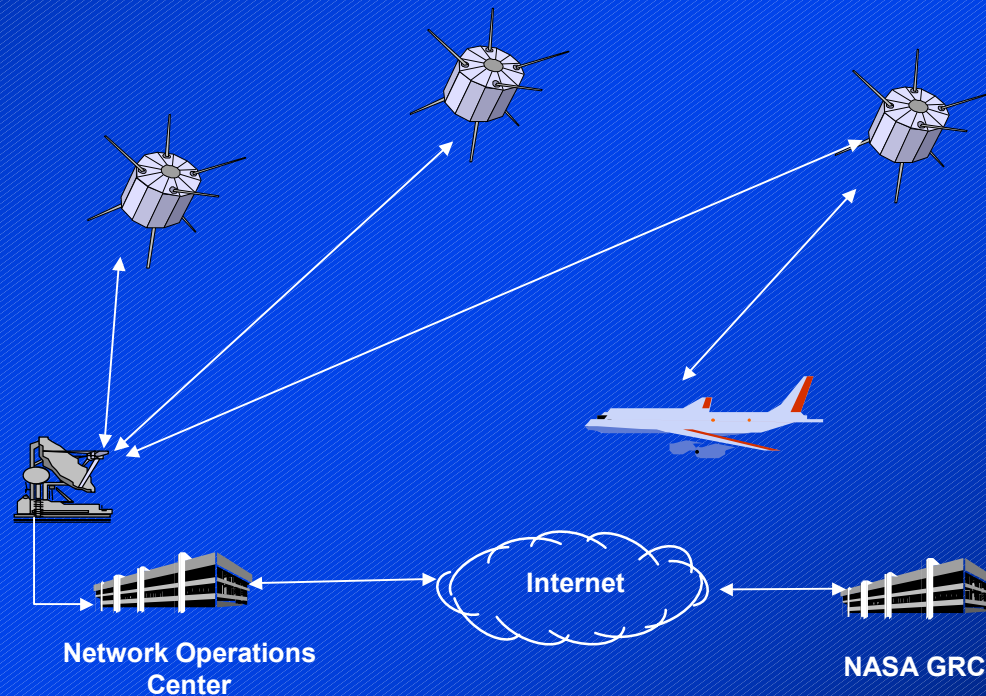

# Echoflight Overview

WINCOMM

Glenn Research Center

The Orbcomm system relays messages transmitted from the aircraft to a Network Operations Center for delivery via the Internet.

# Echoflight Overview

WINCOMM

Glenn Research Center

The testing utilized a WINCOMM developed scripting interface to the off-the-shelf Echomap software in order to send the TAMDAR data as email messages.

The messages were queued once per minute. The messages were transmitted in a First-In-First-Out order, whenever a satellite was in view.

A screenshot of a software window titled "EchoMap" with a "Send Mail" button. The window contains three input fields: "TO" with the email address "tamdar@jyu.grc.nasa.gov", "SUBJ" with the subject "Tamdar", and "MSG" with a long alphanumeric string "0900270092206f300860317000000a". A "SEND" button is located at the bottom left of the window.

# Echoflight Data

WINCOMM

Glenn Research Center

TAMDAR messages were transmitted over the Echoflight system on two flights, the first flight was 2 hours and the second flight was for 4 hours.

During this six hour testing period, only five messages were lost.

	Duration	Average Message Latency	Average Network Delay
Flight 1	2:10:05	0:22:08	0:00:03
Flight 2	4:00:35	0:08:30	0:00:44

Message Latency

# UAT Overview

WINCOMM

Glenn Research Center

The UAT system was an off the shelf Capstone system at 966MHz.

Testing utilized a serial interface to the UPSAT MX-20. The MX-20 software was modified to send an extended ADS-B message with a 30 character TAMDAR message.

UAT Transceiver

# UAT Overview

WINCOMM

Glenn Research Center

TAMDAR messages were sent to the MX-20 every 3.2 seconds, for transmission.

# UAT Data

WINCOMM

Glenn Research Center

TAMDAR messages were transmitted over the UAT system during two 1 ½ hour flights.

Approximately 3400 TAMDAR messages were transmitted and 1000 messages were received at the ground station.

Messages were lost due to the attitude of the aircraft, out-of-range of the transmitter, and not in line-of-sight of the transmitter.

1/25/2002 Flight Track

Each yellow dot represents a TAMDAR message received at the ground station.
